TITLE: Functions of Air-resistance for the Solution of Problems of the External Ballistics

PERIODICAL: Tr. Leningr. voyen.-mekhan. in-t, 1957, Nr 6, pp 400-408

ABSTRACT: The author performs a research on the transformation of the existing laws of resistance (laws of Ciacchi, Garnier, Eberhard, and Havre) into a law of resistance satisfying the modern requirements of the external ballistics of projectiles. Diagrams of the function  $K_1(v)$  and a table of the values of  $K_1(v)$  within the range of velocities from 150 to 1,300 m/sec are given.

TITLE: Thin-film cadmium-sulfide diodes

CITED SOURCE: Sb. Vychisl. sistemy. Vyp. 15, Novosibirsk, 1965, 123-132

21 27

TOPIC TAGS: thin film diode, semiconductor device, electric current, cadmium sulfide, tellurium

TRANSLATION: Construction and I-V characteristics of a thin-film metal-CdS-Te-metal structure were investigated. At low voltages, the characteristic has a resistive segment, after which the current increases in the forward direction according to  $I \approx V^n$  law, where the maximum value of n is 6. As the voltage increases, n decreases to 2. The reverse breakdown voltage is 4-6 v. The rectification factor, at 1 v, is over 10000. The mechanism of current conduction is assumed to be similar to the mechanism of the current limited by a space charge in a trap-type dielectric. Various hypotheses that explain the sharp current rise are evaluated. The assumption of a shock ionization of traps is qualitatively corroborated by the experiments. Bib 10, figs 2.

TITLE: Prospects for using thin-film diodes in measuring instruments

SOURCE: Avtometriya, no. 6, 1965, 36-44

TOPIC TAGS: semiconductor diode, thin film diode, measuring instrument

ABSTRACT: Three types of thin-film diodes<sup>25</sup> are in use: (1) Diodes with space-charge-limited current; (2) Diodes with oxide films whose functioning depends on metal-oxide-boundary phenomena; (3) Heterojunction diodes. Their principal characteristics and the physical phenomena transpiring in them are discussed. The results of an experimental investigation of the second and third types with 0.01 and 0.0003 cm<sup>2</sup> active surface (9 diodes per cm<sup>2</sup>) are reported. Current-voltage characteristics of Ti-oxide-film diodes are shown; these diodes can operate at temperatures up to 200°C; their characteristics do not deteriorate with time (2.5 yrs). CdS heterojunction diodes exhibit very steep characteristics; at 0.2—0.4 v, their forward currents are considerable; at -3—4 v, their reverse currents are 10—40 micro-amp. At temperatures over 100°C, their reverse current rapidly increases. After 100 hrs of continuous operation, the forward current (initially 2 ma) increased by

Cord 1/2

are shown: specific capacitance vs. backing temperature (100-300C); electric strength vs. oxide-film thickness; leakage-current density vs. applied voltage (10-100 v). Al film capacitors are suitable for operation up to 10 or 20 Mc; their temperature coefficient of capacitance is  $-200 \times 10^{-6}$  per 1C within -180 + 240C. On the strength of the above results, the Al thin-film capacitors are recommended for use in electric measuring instruments. Orig. art. has: 6 figures, 1 formula, and 1 table.

TITLE: Thin-film capacitors and the possibility of using them in measuring instruments 18 25

SOURCE: Avtometriya, no. 6, 1965, 28-35

TOPIC TAGS: thin film capacitor, measuring instrument

ABSTRACT: Conventional thin-film capacitors, their construction and characteristics are briefly described. Ta capacitors cannot be used successfully at frequencies over 10 kc. Attention is drawn to the potentialities of Al-Al<sub>2</sub>O<sub>3</sub> capacitors; although Al capacitors are slightly larger because of lower  $\epsilon$  of Al<sub>2</sub>O<sub>3</sub>, they have these advantages: the nondissolving-electrolyte processing, which permits accurate control of the oxide-film thickness; high electric strength of the oxide film; simple method of spraying of Al film; good reproducibility of characteristics; wide class of materials suitable for backings; time stability of characteristics. These experimental curves

TITLE: Complex method for automated investigation of the physical properties of semiconductor diodes [This paper was presented at the 6th All-Union Conference on Automatic Control and Methods of Electrical Measurement held at Novosibirsk in Sept., 1964]  
SOURCE: Avtometriya, no. 3, 1965, 106-112

TOPIC TAGS: semiconductor diode, analog digital converter, dielectric material

ABSTRACT: A method is described for determining the characteristics of semiconductor diodes during continuous variation of external factors within one physical experiment. Results of the experiment (primary information signals) are simultaneously recorded by a pen-recording instrument and an analog-digital converter; then the information produced is processed by computer. This system increases the speed of experimentation and the accuracy of measurement of the parameters in question. This method can be used for investigation of the physical processes connected with contact phenomena in semiconductors and dielectrics.

Graphs 1 Tables 2

There are 2 views on the relationship between Down's disease and the age of the mother. Stoelzner, Bleyer, Bennhold-Thomson, Benda and others contend on the basis of statistical data that children with Down's disease are born of older mothers. The other view, presented by Kłossowsky and Russkikh, is opposed to this statement. The present work aims at finding out whether a relationship exists between mongolism and the age of the mother. The material consisted of 50 cases of children with Down's disease under treatment in the outpatient department of psychical health in Lublin and 200 cases for the control group (166 mental deficient non-mongoloids and 34 normals). The confidence interval for the median of the ages of mothers giving birth to mongoloids was  $32.0 < \mu < 38.6$  against  $26.2 < \mu < 29.0$  in the control group. 58% of the mothers were over the age of 36 at the time of birth of the mongoloid child, with only 12.5% in the control group. These results seem to confirm the supposition that Down's disease is related to the higher age of the mothers. They indicate, however, that the factors causing this disease are not invariably linked with the age of the mother.

34. ANALYSIS OF THE CAUSES OF DEATH AND OF THE DEATH RATE AMONG MOTHERS IN CONNECTION WITH PREGNANCY, PARTURITION AND PUERPERIUM - Analiza przyczyn zgonów i umieralności matek w związku z ciążą porodem i połogiem w latach 1952-1955 - Kostrzewski, K., Odd. Pol.-Ginekol. Szpit. Miejskiego, Radom - POL. TYG. LEK. 1957, T2/46 (1773-1777) Tables 2

The material of the gynaecological-obstetric department of the City Hospital in Radom in the years 1952-1955 was examined. Out of the total number of 12,385 women treated, 37 women died. Haemorrhage is the most frequent cause of death (59.1%); mostly cases which have been hospitalized too late, with a central placenta praevia and with a rupture of the uterus. The remaining percentage of fatal cases consists of heart diseases (22.7%), of diseases not connected with pregnancy (13.7%) and of the post-operative complications (4.5%). (These percentages are apparently based upon a material too small for statistical purposes, Ed.) In the cases of puerperium after a parturition outside the hospital, the principal causes of death are: puerperal infection in 43%, eclampsia in 28.5% and haemorrhages of the 3rd stage of labour in 28.5%. The general death rate in connection with miscarriage and extrauterine pregnancy in the years 1952-1955 was 0.3%, and in the year 1955 0.09% (percentages within the limits of a probable national norm attained in 1953). A further decrease of death rate depends on organizational improvements, such as: a more efficient transport, intensified blood transfusion therapy, and in the first place, more extensive hospitalization in the adequately organized centres.

The statistical analysis of the world's literature indicates that the highest incidence of recrudescences of typhus occurs 18 yr. after the primary infection. The increase of typhus cases in Poland in the years 1930-1935 would correspond theoretically to the interval following the typhus epidemics of the first World War. An important role is attributed to the sporadic recrudescences in the interepidemic periods. A clinical study of 56 typhus patients during 1949-1955 was made establishing 21 recrudescent cases among them. In the latter group the Weil-Felix test was positive in 19% while the complement fixation test gave 23 positive results with the specific rickettsial antigen. Skin rash was observed in 11 cases. No significant clinical differences were established between the primary and recrudescent cases of typhus fever.

2163. KOSTRZEWSKI J. Klin. Chorób. Zakaźnych, Kraków.\* W sprawie uodpar-  
niania przeciw wściekliźnie. Vaccination against rabies POL.  
TYG. LEK. 1956, 11/14 (604-605)

A speculative article based on papers by Nitsch, published in Poland in 1904  
(Medycyna, 1904, 31, 641) concerning the desirability and dangers of vaccination  
against rabies. Nitsch observed that early deaths after a bite by the rabid animal  
occurred more often when followed by vaccination, than in non-vaccinated persons,  
while late deaths were observed more often in non-vaccinated persons. Further  
evidence is brought from other papers concerning experimental vaccination and  
exposure of dogs, and therapeutic vaccination in man and it is concluded that the  
desirability of antirabid vaccination is highly questionable. Kohn - Rehovot

EXCERPTA MEDICA Sec 8 Vol 9/9 Neurology Sept '56

J.I.II, KOSTRZEWSKI J. Klin. Chorób Zak., A.M., Kraków. "Czym jest spowodowana różnica skuteczności surowicy przeciwteczowej zależnie od tego czy ją użyto jako środka zapobiegawczego, czy leczniczego? Why is the anti-tetanus-serum prophylactically effective and therapeutically ineffective?" PCL, TYG, LEK, 1955, 10/36 (1173-1174)

This fact is best explained by the author's theory that tetanus toxin is active only during the incubation. In this period it produces disturbances in the metabolism of acetylcholine and other functional disorders. After this it is completely exhausted and no more tetanus toxin action exists at the beginning of the clinical manifestations. The evolution of humoral disorders continues in analogy to the enzymatic reactions without further cooperation of the toxin. Tetanus-antitoxin applied during the incubation neutralizes tetanus-toxin active in this period, its clinical use is therefore indicated and its action well understood. In the following period, i.e. during fully developed tetanus the use of tetanus-antitoxin is ineffective, because no more tetanus-toxin is present which could be neutralized.

KOSTRZEWSKI J. State Inst of Hygiene, Cracow. Epidemiologia graczki okopowej. The epidemiology of trench fever. Bulletin International de L'Academie Polonaise des Sciences et des Lettres, Cracow 1949, 7-10 (233-263) Graphs 7 Tables 2

During World War II trench fever assumed an epidemic character on the Eastern front. Indications are that in the louse or in its excreta *R. quintana* may preserve its virulence up to one year. In trench fever patients the rickettsiae appear in the circulating blood, urine and rarely in the saliva. In convalescents rickettsiae persist in the blood during the first weeks, months and even up to eight years, after the cessation of symptoms. The infection is conveyed to man by rubbing the excreta into the skin or by inhalation. Asymptomatic infections with the presence of rickettsiae in the blood of healthy persons were recorded. This carrier state may either be transitory or may last for several months and even years. The diagnosis is aided by microscopic agglutination and complement-fixation tests using suspensions of *R. quintana* as antigen. Anigstein--Galveston (XX, 6. 4)

Warsaw, Polski Tygodnik Lekarski, Vol 13, No 32, 5 Aug 63,  
pp 1175-1180

Abstract: [Author's English summary modified] Statistical analysis on the relationship between mongolism and the age of either parent, taken from author's doctoral dissertation, covering 180 cases with Down's disease, with 180 cases of endogenous mental deficiency serving as controls. The computed average older ages of both mothers and fathers were found to be statistically significant (order of  $P < 0.001$ ). Author notes that these findings found support in recent studies on chromosomal abnormalities in mongoloid children and their parents, and considers it essential to investigate the factors which may cause meiotic disturbances in general, and especially in young parents under 35. There are 19 references, of which 6 are in Polish and 13 in English.

Investigations on recrudescences of typhus in Poland carried out in 1952-55 have furnished new observations, which permit the supplementation of the lists of recrudescences collected from the foreign literature published in 1953. In order to ascertain the relation between the recrudescences of typhus and the period elapsing from the first onset of illness, calculations have been made again. These show that, in agreement with the former calculations, recrudescences begin to appear in increasing numbers 6-10 yr. after the first onset of illness and their number increases rapidly during the next 10-15 yr. The further course of the curve illustrating the wave of recrudescences, however, differs from what was previously supposed, since it attains its peak presumably after the elapse of 18-20 yr, and then very slowly subsides for a period of 20-50 yr. If the assumption and the calculation resulting from it were correct, then in Poland we may continue to expect a rise during the next few years in the number of recrudescences of typhus from the epidemic which occurred during the Second World War, and after 1960 these numbers should gradually diminish.

1222. INVESTIGATIONS ON THE EPIDEMIOLOGY OF TYPHUS RECRUDESCENCES IN POLAND - Kostrewski J., State Inst. of Hyg., Dept. of Epidemiol., Warsaw - J. HYG. EPIDEM. MICROBIOL. IMMUNOL. (Prague) 1957, 1/3 (237-244) Graphs & Tables 1

A statistical analysis of recrudescences of typhus, prepared from the world literature and from cases observed in Poland (1952-1955), showed that their appearance is in relation to the time which has elapsed since the first attack. In the first years after the illness, the number of recrudescences is small, but a very distinct rise can be observed after a lapse of 10-15 yr. On the basis of this analysis, theoretical calculations were made of the probable wave of typhus recrudescences in Poland after the great epidemics of the 2 world wars. It follows that in 1952-56 the number of recrudescences should rise. Epidemiological observations made in Poland confirm the forecasts. From 1952-1955 the notified number rose from 7 to 61 recrudescent cases. No characteristic intensification of typhus in spring and winter occurred since 1953, but recrudescences appeared throughout the whole year.

766. SPORADIC EXANTHEMATIC TYPHUS IN POLAND. Typhus exanthématique sporadique en Pologne - Kostrzewski J. Inst. Nat. d'Hyg., Varsovie. ANN. INST. PASTEUR 1956, 91/6 suppl. (15-24) Graphs 7 Tables 1
- Sporadic typhus fever (Brill's disease) is clinically often atypical, the duration of fever not exceeding 7-10 days; the skin rash may be scanty or absent. Instead of a moderate leucocytosis in epidemic typhus, leucopenia and lymphocytosis occur in sporadic typhus. The Weil-Felix test is not reliable in sporadic typhus since in 50% of cases it is negative or too weak. Among all typhus cases for 1952-1954, in 39.6% of cases the disease followed a previous typhus infection in the past. The summer incidence of sporadic typhus in Poland is contrary to the winter incidence of epidemic typhus. Since recrudescences of typhus were recorded as late as 50 yr. after the first infection, the eradication of typhus seems impossible during the future years. A replacement of the killed vaccine by a live attenuated strain of Rickettsia prowazekii (E) is recommended. Anigstein - Galveston, Tex. (L, 6, 17)

AUTHOR: Kostrzewski, Hubert

TITLE: Scrubbing mass for acetylene

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1963, 473, abstract  
2P208 (Polish patent 45728, March 15, 1962)

TEXT: For scrubbing  $C_2H_2$ , 3.5-4.5 parts by weight of  $ZnCl_2$  per 1000 parts by weight of mass are incorporated into a mass which contains Fe and Cu salts (with inert carrier). Example: 508 parts by weight of the inert carrier were impregnated with a mixture of Fe, Cu, and Zn salt solutions (commercial products). Such a mixture contained 306 parts by weight of  $FeCl_3$ , 33 parts by weight of  $CuSO_4 \cdot 5H_2O$ , and 4 parts by weight of  $ZnCl_2$ .

The resultant mass was used for the scrubbing of  $C_2H_2$ . The mass still retained its scrubbing effect after scrubbing and regeneration by air repeated ten times. [Abstracter's note: Complete translation.]
